

**Documentation drift takes unforeseeable forms;
only "explicit-positive + unreadable" aggregation is robust to all of them**

	Aggregation rule A: "not-explicitly-normal" (never approved)	Aggregation rule B: "explicit-positive + unreadable" (V3.0, adjudicated)
Form 1 Template enumeration (2022)	Enumerated flags extracted; rhythm-only lines → counted abnormal	Enumerated flags extracted correctly; no outcome distortion
Form 2 Misplaced field content (2023)	Any misplaced content → record counted abnormal (panel verdict: unreadable)	Pre-registered rule: misplaced content → unreadable (excluded)
Form 3 Conclusion sparsification (2023)	Rhythm-only lines → record counted abnormal (panel verdict: normal)	No flag positive → normal by enumeration; no distortion

Definition-divergent stratum (2023): 3,204 records = 14.8% of the 2023 cohort (3.6–8.3 pp in 2018–2022). Panel adjudication of the 2023 decision stratum (n = 100): 15% abnormal, 76% normal, 9% unreadable.
